This workflow is triggered when there is a `repository_dispatch`. A `repository_ dispatch` in GitHub is basically an HTTP request to your GitHub project instructing GitHub to start any action or webhook. In our example, a `repository_dispatch` with the event type `contract_requiring_verification_published` will trigger the workflow.

Looking at the environment variables, `PACT_BROKER_BASE_URL` is missing and replaced with `PACT_PAYLOAD_URL`. This is because we want to verify the newly published contract from the consumer that caused the `contract_requiring_verification_published` event to be triggered. The steps in our `contract-verification-via-webhook` are as follows:

1. Checking out the specific GitHub SHA if the Pact URL is from the webhook
2. Setting up a Node action so dependencies can be cached
3. Installing the project dependencies added to your package.json file
4. Running the MoviesAPI provider tests

10.4.3 Updating provider options

To use the `PACT_PAYLOAD_URL`, we need to update the provider options to use this URL instead if this is provided. Looking at the provider/provider-contract.spec.js file, the provider options should look similar to the following code snippet:
