any of the consumer tests from the consumer-contract.spec.js file. For example, you can update the WebConsumer expectations that they are now expecting a status code of 201 instead of 200, for demonstration purposes, as shown in the following code snippet:

```
provider
  .uponReceiving('a request to all movies')
  .withRequest({
    method: 'GET',
    path: '/movies',
   })
   .willRespondWith({
     status: 201,
     body: eachLike(EXPECTED_BODY),
   });
```

Commit the changes to your new branch, and push it to your forked project. You should see the contract-test job running and eventually failing on the can-i-deploy step because the verification between the WebConsumer and the version of MoviesAPI that is currently in production failed.

On the provider pipeline, workflow `contract_requiring_verification_published` was triggered automatically, as shown in figure 10.19. However, it failed because the provider sent a status code of 200 instead of 201.

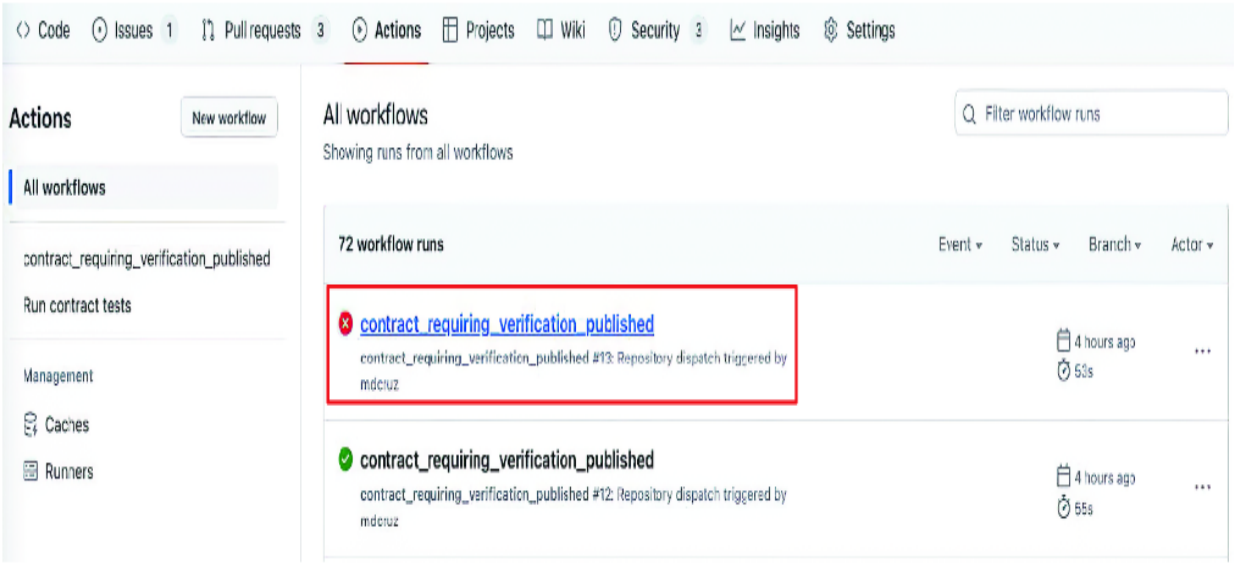

Figure 10.19 Failed workflow from the provider side due to a mismatch in consumer expectations
