- For a webhook to be triggered, Pact listens to specific events. The “contract requiring verification published” event is triggered when the consumer has published a contract with amendments.
- When using Pact webhooks, you need to set the `pactUrls` options instead of `pactBrokerUrl` to ensure the provider verifies the newly amended contract sent by the webhook request.
- To ensure that the can-i-deploy step retries while the provider verification is still running and the result is still unknown, you can add `--retry-while-unknown=<NUM>` as part of the can-i-deploy command.
