

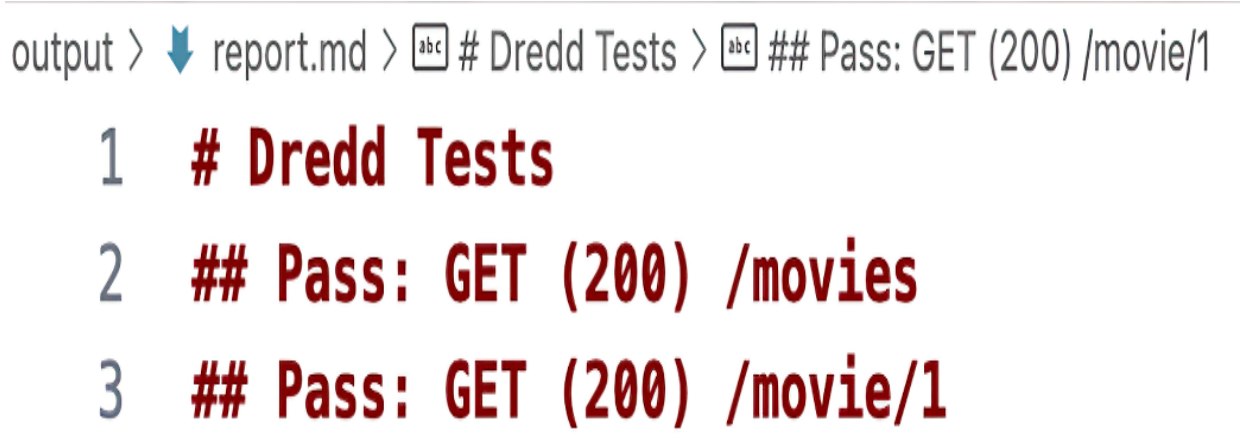

Figure 11.5 Dredd test output results, stating the scenarios tested

11.3.3 Publish provider API specification and test results

With PDCT, the provider must publish the test results alongside their OpenAPI specification. PactFlow offers a provider `publish` command as part of the Pact CLI `publish-provider-contract`. The `publish` command takes the OpenAPI specification file and test verification results alongside the tool used to run the API tests, as shown in the following listing, which references the Dredd example.

Listing 11.19 Publish provider contract and test results

```
pactflow publish-provider-contract
 ./output/movies-api.json     #1
 --provider BiDreddMoviesAPI
 --provider-app-version $(npx -y absolute-version)
 --branch $(git rev-parse --abbrev-ref HEAD)
 --content-type application/json
 --verification-exit-code=0
 --verification-results ./output/dredd-report.md
 --verification-results-content-type text/plain
 --verifier dredd
```

#1 OpenAPI specification file location

The downloaded OpenAPI specification is in the output folder. The script downloads the OpenAPI file from the API provider running locally at the URL `http:// localhost:3001/swagger.json`. It then uses cURL to copy the contents of the response from this endpoint to a local file, as shown in listing 11.20. Finally, it makes the OpenAPI file available for reference in the `publish-provider-contract` command.
