Figure 12.2 Contract and integration test responsibility boundary, showing how integration tests check for infrastructure and database problems as well as request and response errors

At the start of a software development project, an OpenAPI specification is often created. At this point, the frontend developer and backend developer or separate development teams can start working on the feature using the specification. The specification includes how to make a request to the endpoint and the expectations of the response, as shown in the following listing. At this point, it’s static documentation, updated by a human as changes are made during the implementation of the feature.
