Listing 12.4 Pact provider for the movies API

```
const port = '3001';
const app = server.listen(port, () =>
  console.log(`Listening on port ${port}...`));

const options = {
  provider: 'MoviesAPI',
  providerBaseUrl: `http://localhost:${port}`,
  pactBrokerToken: process.env.PACT_BROKER_TOKEN,
  providerVersion: process.env.GITHUB_SHA,
  providerVersionBranch: process.env.GITHUB_BRANCH,
  publishVerificationResult: true,
  stateHandlers: {
    'get movies when none exist in database': () => {
      movies.deleteAll();
      return Promise.resolve({ description: 'Movies deleted' });
    }
  }
}

const verifier = new Verifier(options);

describe('Pact Verification', () => {
  test('should validate the expectations of movie-consumer', () => {
    return verifier
      .verifyProvider()
      .then(output => {
        console.log('Pact Verification Complete!');
           app.close();
      });
    });
});
```

Let’s take a look at another example, this time in Postman, as shown in figure 12.4. Take the get movie by ID endpoint (`/movie/1`), which returns a JSON response, including ID, name, and year.
