Summary

- Integration tests are still important for testing that build configurations are deployed successfully.
- Contract tests can be implemented as early as from when the OpenAPI documentation is created.
- Integration tests are suitable for migration when they verify the structure of the API response.
- Legacy integration tests can be refactored to contract tests to improve stability and reduce maintenance.
- Contract tests focus on a range of API scenarios, including error conditions, where integration tests overlap in terms of retrieval of data and happy path scenarios.
- Integration tests that verify status codes, headers, and data types—instead of specific values—are good candidates to convert to contract tests.
- Teams save time debugging and reduce cost on integration environments by converting to contract tests.
- E2E tests can be split into two sets of tests: where E2E tests use mocks, and contract tests verify the mocks.
