type `git clone`, and paste the GitHub project URL. The GitHub name will be your GitHub name:

```
git clone https://github.com/mdcruz/pact-js-example.git
```

After you run the command, you should now see the contents of the GitHub project on your local machines. The GitHub project contains all the dependencies that you require for contract testing. To install the project dependencies that came with the project, run the following command in your terminal where the project is located:

```
npm install
```

B.4 Downloading the project

While downloading the project manually provides the easiest way, downloading the GitHub project will mean losing access to source control, and your changes won't be tracked. We recommend that you fork the GitHub project to create a copy of the project and clone it locally. If you still want to download the project manually, visit https://github.com/mdcruz/pact-js-example/, and switch to the Setup-Contract-Tests-Consumer branch by clicking the Branches list, as shown in figure B.5.
