the example GitHub project, you can see the provider contract test, which is similar to the following:

```
const options = {                              #1
  provider: 'my-provider',                    #1
  providerBaseUrl: 'http://localhost:4000',   #1
  pactBrokerUrl: PACT_BROKER_BASE_URL,        #1
  pactBrokerToken: PACT_BROKER_TOKEN,         #1
  publishVerificationResult: true,            #1
};

const verifier = new Verifier(options);       #1

describe('Pact Verification', () => {
  test('should validate the expectations of movie-consumer', () => {
    return verifier
      .verifyProvider()          #2
      .then(output => {
        console.log('Pact Verification Complete!');
        console.log('Result:', output);
        app.close();
      })
  });
});
```

#1 Sets up the provider and where to pull the contract that the consumer uploaded
#2 Verifies the contract

Before running the provider contract test, the provider needs to be running in the background because the expectations from the consumer will be run against the real provider. As part of the test, the provider validates the request from the consumer and sends the actual response to that request. The contract testing tool compares the actual response with the expected response from the consumer and then sends the results back to the shared broker. We'll further explain the process of writing a provider contract test in chapter 6.

Once the provider verification result is recorded to the shared broker, the contract testing tool notifies the consumer that their changes have been verified. If the test passes, both the consumer and provider are safe to deploy their changes to production.

The high-level example shows how consumer and provider contract tests work together. When we first started learning about contract testing, the high-level description of contract testing went completely over our heads. It wasn't until we started implementing it and created a proof of concept that we fully understood the true value of contract testing. After reading the
