

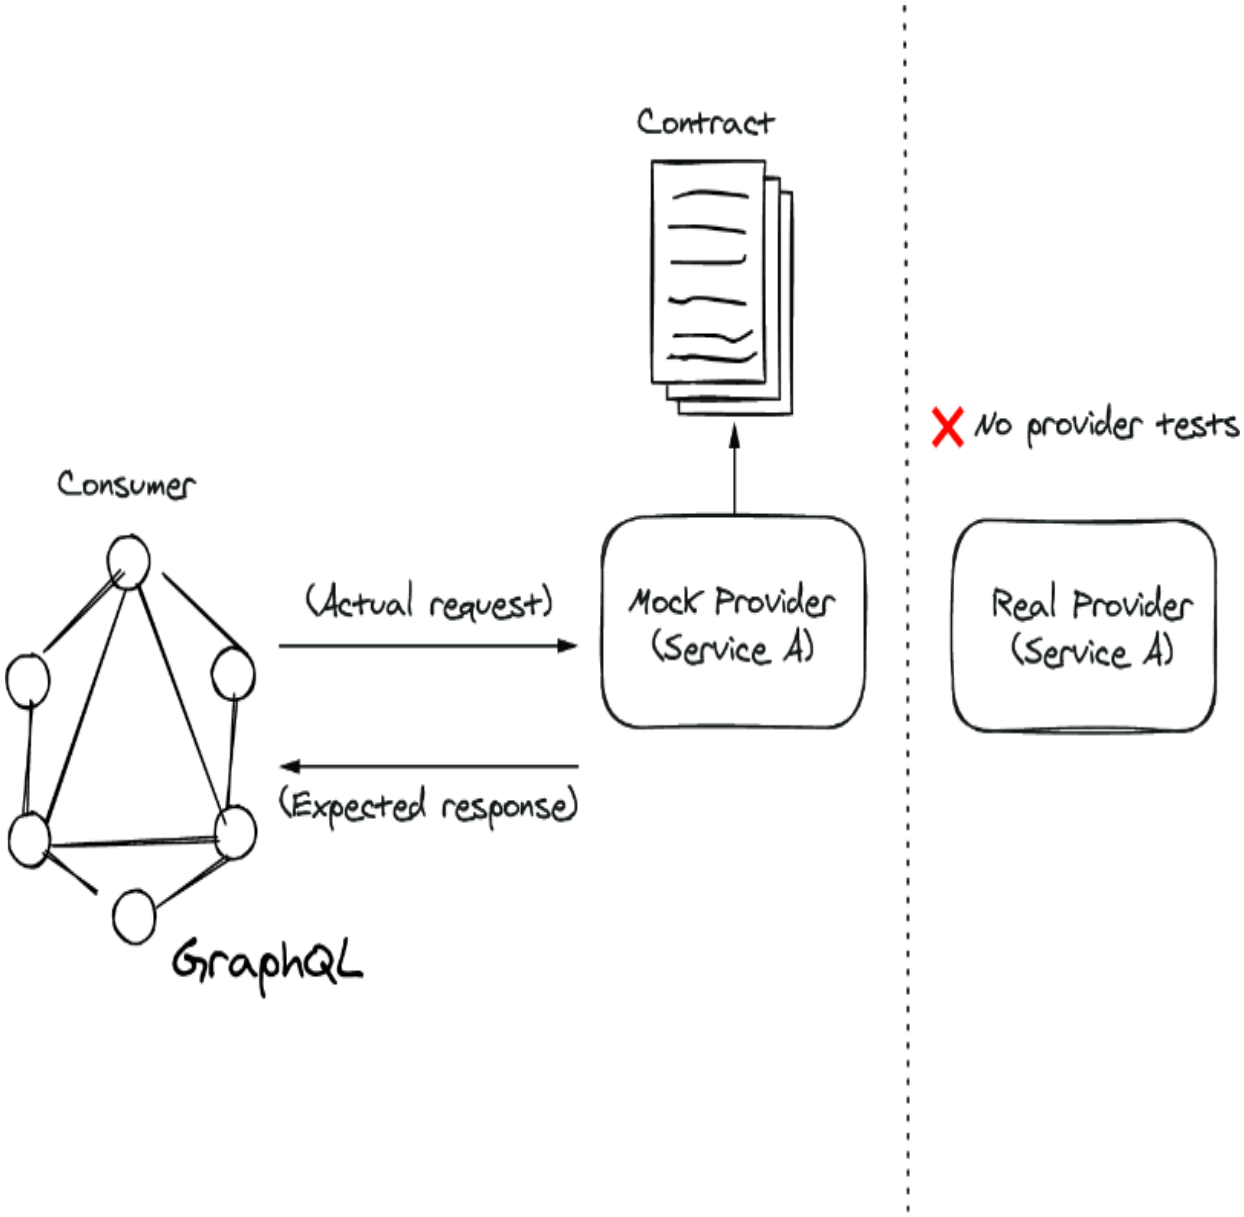

Figure 2.1 Contract testing setup for a GraphQL consumer communicating to a data service. The consumer has generated the contract, but it's not verified by the real provider because there are no provider tests.

None of the data providers had corresponding provider contract tests in place. Despite the presence of consumer contract tests within the GraphQL layer, the data providers lacked the means to verify the established contract, which means that breaking changes could be introduced and then slip into testing and/or production environments. This is especially true if the end-to-end (E2E) tests, which assess the functionality of an application
