components. This distinction requires additional knowledge and familiarity with contract testing principles.

As a popular contract testing tool, Pact also provides advanced features and functionalities that require a deeper level of comprehension. Concepts such as *can-i-deploy* allow teams to determine whether a change to a consumer or provider system adheres to the existing contract, enabling confident deployment decisions. *Webhooks* facilitate real-time communication between consumer and provider systems, supporting changes to contract testing scenarios. *Versioning* ensures compatibility and contract management when systems evolve over time.

To fully use the benefits of contract testing and Pact, it’s crucial to become proficient in implementing these advanced concepts. Chapter 8 serves as a comprehensive guide, walking you through the step-by-step implementation of these advanced features. We’ll provide practical examples, explanations, and best practices to guide you with the necessary skills and understanding.

2.5.5 Difficult when there are external teams

Implementing contract testing becomes much easier when both consumer and provider teams are internal to the company. However, in many scenarios, collaborations involve external teams. This presents a challenge for contract testing, particularly when the data provider(s) are third-party or external services.

When dealing with external teams or third-party data providers, the process of implementing contract testing encounters additional complexities. External teams often operate independently and have their own established testing practices. They might also argue that they have a solid testing strategy in place already. Convincing them to adopt contract testing and integrate provider tests into their pipelines requires effective communication, collaboration, and an understanding of their existing workflows and concerns. They may also be reluctant to include provider tests in their CI pipelines due to factors such as time constraints, lack of resource allocation, and priority problems. Fortunately, the good news is
