- Username (string)

Remember that the contract should only include the consumer expectations from the provider. It should check the format or the structure of the response and verify if there are any misunderstandings between a consumer and a provider. Your contract shouldn’t cover any business logic or any side effects that might happen on other systems.

2.6.4 Write a basic consumer and provider contract test

Once you have a basic contract in place, it’s time to write the consumer and provider test. We recommend using the same programming language used by the consumer and provider codebase for the contract test. Chapters 4 to 8 cover how to write contract tests for different types of consumers and providers. For now, the high-level contract testing process between a consumer and a provider is illustrated in figure 2.11.
