2.6.5 Add contract testing to your CI/CD pipelines

Once you've written your first consumer and provider tests and you're able to verify the interaction successfully by triggering the test locally, the next step is to add both the consumer and provider contract tests as part of your CI/CD pipelines so that the tests are triggered by new changes that respective teams are working on. Depending on which CI/CD pipelines you're using, the syntax of setting these tests up to run will be slightly different, but the workflow should remain the same.

Let's look at a basic contract testing workflow in your CI/CD, with manual triggers of the provider verification, which you can see in figure 2.12. We'll cover manual triggers for now to get you started, but we'll introduce you to an automatic trigger pipeline in chapter 10.
