Listing 3.1 Pact contract example

```
    "consumer": {     #1
    "name": "Web"
    },
    "provider": {    #1
        "name": "API"
    },
    "interactions": [     #2
    {
        "description": "GET user token",
        "providerState": "user authentication setup",
        "request": {
          "method": "GET",
          "path": "/token/1234",
          "headers": {
            "Accept": "application/json, text/plain, */*"
          }
         },
        "response": {
          "status": 200,
        "headers": {
             "Content-Type": "application/json"
           },
           "body": {
             "token": "bearer xxx"
           },
        "matchingRules": {     #3
          "$.body.token": {
            "match": "type"
          }
        }
      }
    }
   ],
      "metadata": {
        "pactSpecification": {
          "version": "4.0"
        }
      }
    }
```

#1 Participants
#2 Set of interactions
#3 Matching rules to allow for more flexible matching of data

As shown in the JSON example, the contract has the names of both the consumer and provider, and you should start thinking about a naming convention for these, as the consumer and provider use these throughout the process. The contract also includes interactions, which lists all the information related to the request, expected response, description, provider states (covered in chapter 6), and matching rules (covered in chapter 4). The contract also includes the metadata associated with the Pact framework only.
