**Figure 3.3 A public version of Pact Broker provided by the UK Government (https://mng.bz/dZlQ) shows a real example of Pact Broker in use.**

To enable consumers and providers to check if they can safely deploy their changes to production, Pact provides a command-line interface (CLI) tool called can-i-deploy, which enables consumers and providers to query the broker to determine the verification status of the contract. The broker is effectively cementing the agreement between a consumer and provider.
