providers to access, holds the status of the contract based on the version, and shows all the different consumer relationships for providers.

3.5 Consumer-driven contract testing life cycle

To introduce the core concepts of contract testing, we describe the life cycle of the CDCT approach. The example uses JavaScript and Java but applies to all other language combinations. Figure 3.5 shows the CDCT approach, and the process is also explained in the following steps:

1. The consumer maintaining a JavaScript application publishes the contract to a broker.
2. The provider maintaining a Java API or event service pulls down and verifies the contract from the broker.
