DEBUG, INFO, WARNING, ERROR) and can be turned on or off depending on the need. Python's `logging` module is an excellent tool for this purpose.

```
import logging
logging.basicConfig(level=logging.DEBUG)

def add_numbers(a, b):
    logging.debug(f"Adding {a} and {b}")
    return a + b
```

Unit Testing Unit testing involves testing individual components (or units) of your code in isolation to verify their correctness. By writing tests for specific functions or modules, you can quickly catch errors early in the development process. Python's built-in `unittest` module or third-party libraries like `pytest` are useful for creating and running unit tests.

Example of a simple unit test:

```
import unittest

def add_numbers(a, b):
    return a + b

class TestAddition(unittest.TestCase):
    def test_add_numbers(self):
```
