Setting Breakpoints Breakpoints allow you to stop execution at a specific line of code. In gdb, you can set a breakpoint at a particular function or line number:

(gdb) break main
(gdb) break 25 # Set breakpoint at line 25

3.

Running the Program Once you have set your breakpoints, you can start the program within gdb using the `run` command:

(gdb) run

4.

Inspecting Variables When the program hits a breakpoint, it pauses execution. You can now inspect variables using the `print` command:

(gdb) print my_variable

5.

Stepping Through the Code You can step through your code line by line using `step` (to enter functions) or `next` (to skip over functions):

(gdb) step # Step into a function
(gdb) next # Step over a function
