```
# Define the function for addition
def add(x, y):
    return x + y

# Define the function for subtraction
def subtract(x, y):
    return x - y

# Define the function for multiplication
def multiply(x, y):
    return x * y

# Define the function for division
def divide(x, y):
    if y == 0:
        return "Error! Division by zero is not allowed."
    return x / y
```

Here, each function corresponds to one of the four arithmetic operations. Notice that the `divide` function includes a check to prevent division by zero, which would cause an error in the program.

Step 2: Create a Function to Display the Menu

We need a menu for the user to choose the operation they want to perform. This will be displayed each time
