```
gcc --version
```

If the installation is successful, this will display the installed GCC version.

Compiling and Running Your First Program

Now that your environment is set up, let's create, compile, and run a simple C program.

Step 1: Writing the Code:

Create a new file named `hello.c` and enter the following code:

```
#include <stdio.h>

int main() {
    printf("Hello, World!\n");
    return 0;
}
```

Explanation:

- `#include <stdio.h>` : This line includes the standard input-output library, which allows the use of `printf` .
- `int main() { ... }` : The `main` function is the entry point of any C program.
- `printf("Hello, World!\n");` : Prints the message "Hello, World!" followed by a newline character (`\n`).
