```
    age = int(input("Enter student age: "))
    grade = input("Enter student grade: ")
    students[roll_number] = {'name': name, 'age': age, 'grade': grade}
    print(f"Student {name} added successfully!")
```

In this function:

- We first check if the roll number already exists in the dictionary.
- If it doesn't exist, we prompt the user to enter the student's details and add the new student to the `students` dictionary.

---

2. **Read (View Student Records):** This function will allow the user to view the list of all students or search for a specific student by their roll number.

```
def view_students(students):
    if not students:
        print("No students found.")
    else:
        for roll_number, student_info in students.items():
                print(f"Roll Number: {roll_number}")
                print(f"Name: {student_info['name']}")
                print(f"Age: {student_info['age']}")
                print(f"Grade: {student_info['grade']}")
```
