```
        print("-" * 20)
```

Here:

- We loop through the `students` dictionary and print the details of each student.
- If there are no students in the system, we notify the user.

---

3. **Update (Modify Student Records):** This function will update the details of an existing student. We'll allow the user to update the name, age, or grade.

```
def update_student(students):
    roll_number = int(input("Enter roll number to update: "))
    if roll_number not in students:
        print("Error: Student with this roll number does not exist.")
    else:
        print("Current details:")
        print(f"Name: {students[roll_number]['name']}")
        print(f"Age: {students[roll_number]['age']}")
        print(f"Grade: {students[roll_number]['grade']}")

        # Ask for new details
        name = input("Enter new name (leave empty to keep current): ")
        age = input("Enter new age (leave empty to keep current): ")
```
