- The loop runs indefinitely until the user chooses to exit.
- Based on the user's choice, we call the corresponding function (e.g., `add_student()`, `view_students()`, etc.).

Step 4: Running the Program

Now, we can test our Student Management System by calling the `main()` function.

```
if __name__ == "__main__":
    main()
```

This ensures that when the script is executed, the program starts and the user can interact with it through the console.

Step 5: Error Handling

It is crucial to add error handling to ensure the program behaves correctly even if unexpected inputs are given by the user. We have already handled:

- **Invalid roll numbers** during add, update, and delete operations.
- **Non-numeric inputs** when asking for the student's age.
- **Invalid menu choices** in the main menu.

Additional error handling could include:
