2. **Decrypt Function**: This function reverses the encryption by shifting the characters back by the same amount.

```
def decrypt(text, shift):
    decrypted_text = ""
    for char in text:
        if char.isalpha():
                # Shift the character back within the alphabet
                shifted = ord(char) - shift
                if char.islower():
                    if shifted < ord('a'):
                        shifted += 26
                elif char.isupper():
                    if shifted < ord('A'):
                        shifted += 26
                decrypted_text += chr(shifted)
        else:
                # Non-alphabetic characters remain unchanged
                decrypted_text += char
    return decrypted_text
```
