```
            break

    else:
            print("Invalid choice. Please enter 1, 2, or 3.")
```

Explanation:

- The user is presented with three options: encrypt a file, decrypt a file, or exit the program.
- For both encryption and decryption:
    - The user is asked for the file path, and the file content is read.
    - The user provides the shift value (encryption key).
    - The content is encrypted or decrypted, and the result is saved to a new file.
- The program continues to run until the user chooses to exit.

Step 5: Running the Program

You can run the program by calling the `main()` function. The program will allow you to interactively choose operations on files.

```
if __name__ == "__main__":
    main()
```

When the script is executed, the program will display the menu and allow you to encrypt or decrypt files as described.
