6. **Putting It All Together**

Step 1: Setting Up the Game Board

The game board will be represented as a 3x3 grid, and we can use a list of lists in Python to store it. Each cell in the grid will be initialized as an empty string, and players will replace these empty spots with either 'X' or 'O' as they take turns.

```
def initialize_board():
    return [[' ' for _ in range(3)] for _ in range(3)]
```

Explanation:

- We define a function `initialize_board()` that returns a 3x3 list (board) with each element initialized to a space `' '`.

Step 2: Displaying the Game Board

After each move, we need to display the current state of the game board. We'll create a function that prints the board in a readable format.

```
def display_board(board):
    print("-------------")
    for row in board:
```
