```
        print("|", " | ".join(row), "|")
        print("-------------")
```

Explanation:

- The `display_board()` function loops through each row in the `board` and prints it in a readable format with vertical lines separating the cells and horizontal lines separating the rows.

Example output:

```
-------------
| X | O | X |
-------------
| O | X | O |
-------------
| X | O | X |
-------------
```

Step 3: Handling Player Turns

Next, we need to handle player turns. Each player will choose a cell to place their mark. We'll prompt the user to enter a row and column index, and we'll ensure that the move is valid (i.e., the cell is empty and within bounds).
