Step 4: Checking for a Winner

We need a function to check if either player has won the game. A player wins if they manage to get three of their marks in a row, either horizontally, vertically, or diagonally.

```
def check_winner(board, player):
    # Check rows
    for row in board:
        if all(cell == player for cell in row):
                return True

    # Check columns
    for col in range(3):
        if all(board[row][col] == player for row in range(3)):
                return True

    # Check diagonals
    if all(board[i][i] == player for i in range(3)) or all(board[i][2 - i] == player for i in range(3)):
        return True

    return False
```
