- The `check_winner()` function checks each row, column, and diagonal to see if all cells contain the current player's mark.
- The function returns `True` if the player has won and `False` otherwise.

Step 5: Checking for a Draw

A draw occurs if all cells are filled, but no player has won. We can check for a draw by ensuring there are no empty cells (`''`) left on the board and that no winner has been found.

```
def check_draw(board):
    return all(cell != '' for row in board for cell in row)
```

Explanation:

- The `check_draw()` function checks if there are any empty cells remaining on the board. If there are no empty cells and no winner has been determined, it returns `True`, indicating a draw.

Step 6: Putting It All Together

Now, we will combine all the individual functions into a complete game loop that will run until a player wins or the game ends in a draw.

```
def main():
    board = initialize_board()
```
