```
current_player = 'X'

while True:
    display_board(board)
    player_turn(board, current_player)

    if check_winner(board, current_player):
            display_board(board)
            print(f"Player {current_player} wins!")
            break
    elif check_draw(board):
            display_board(board)
            print("It's a draw!")
            break

        # Switch player
        current_player = 'O' if current_player == 'X' else 'X'

if __name__ == "__main__":
    main()
```

Explanation:

- The `main()` function initializes the game board and sets the starting player to 'X'.
