- A `while` loop runs the game, alternating between players. After each turn, the game checks if a player has won or if the game has ended in a draw.
- The `current_player` is switched after each turn using the ternary operator (`'O' if current_player == 'X' else 'X'`).

How the Game Works

1. The game starts by displaying the empty board.
2. Player 'X' is prompted to make their move by entering the row and column numbers (between 0 and 2).
3. The board is updated, and the game checks if Player 'X' has won or if the game is a draw.
4. If no winner or draw is found, it's Player 'O's turn. The same process repeats.
5. The game ends when one player wins or when all cells are filled, resulting in a draw.

Enhancements and Further Exploration

While this basic Tic-Tac-Toe game is functional, you can enhance it in the following ways:

1. **AI Opponent**:

    - Implement an AI opponent using the minimax algorithm. This allows the computer to play optimally against a human player.
