- You can use libraries like `random` to make the AI's moves seem less predictable or create a more challenging AI.

2. **Graphical User Interface (GUI)**:

   - Use Python's **Tkinter** library to create a simple graphical interface for the game instead of a text-based one.

3. **Better Input Validation**:

   - Add more sophisticated input validation, ensuring that users cannot enter invalid moves (e.g., characters or out-of-bound numbers).
   - Provide clear instructions on how to play and what the game expects from the user.

4. **Multiplayer Support**:

   - Extend the game to support online multiplayer. Use Python's **socket** library or web frameworks like **Flask** or **Django** to build an online version of the game.

Conclusion

In this project, we built a simple **Tic-Tac-Toe** game using Python. We started by setting up a text-based interface, creating a 3x3 game board, handling player turns, checking for winners and draws, and displaying the board after every move. This project is a great way to practice working with lists, loops, and functions in Python.
