1. **Linear Search**
2. **Binary Search**

Step-by-Step Guide to Build the Data Sorting and Searching Application

We will break down the process into the following steps:

1. **Setting Up the Data**
2. **Sorting Algorithms**
3. **Searching Algorithms**
4. **User Interface (UI)**
5. **Putting It All Together**

Step 1: Setting Up the Data

The first step is to set up a data structure to hold the data we want to sort and search. For simplicity, we will use a list of integers, but the application can be extended to handle other types of data (e.g., strings, floating-point numbers).

```
def get_data():
    data = input("Enter a list of numbers separated by spaces: ")
    data_list = list(map(int, data.split()))
    return data_list
```
