Explanation:

- The outer loop runs for each element in the list.
- The inner loop compares each element with the next and swaps them if needed, bubbling the larger elements toward the end of the list.

2. Selection Sort

Selection Sort works by repeatedly selecting the smallest (or largest) element from the unsorted part of the list and moving it to the sorted part.

```
def selection_sort(data):
    n = len(data)
    for i in range(n):
        min_index = i
        for j in range(i+1, n):
                if data[j] < data[min_index]:
                    min_index = j
        data[i], data[min_index] = data[min_index], data[i]  # Swap
    return data
```

Explanation:

- The outer loop iterates through each element in the list.
