- The inner loop finds the minimum element in the unsorted part of the list and swaps it with the element at the current position.

3. Insertion Sort

Insertion Sort builds the sorted list one element at a time by inserting each new element into its correct position in the sorted portion of the list.

```
def insertion_sort(data):
    for i in range(1, len(data)):
        key = data[i]
        j = i - 1
        while j >= 0 and key < data[j]:
            data[j + 1] = data[j]
            j -= 1
        data[j + 1] = key
    return data
```

Explanation:

- The outer loop picks the next element (key) and inserts it into its correct position by shifting the larger elements to the right.
