Step 4: User Interface (UI)

To make the application user-friendly, we will implement a simple menu-driven interface that allows users to select sorting or searching algorithms and input the required data.

```
def display_menu():
    print("\nData Sorting and Searching Application")
    print("1. Sort Data")
    print("2. Search Data")
    print("3. Exit")
    choice = input("Enter your choice (1/2/3): ")
    return choice

def main():
    data = get_data()

    while True:
        choice = display_menu()

        if choice == '1':
                print("Sorting Algorithms:")
                print("1. Bubble Sort")
                print("2. Selection Sort")
                print("3. Insertion Sort")
```
