-

datetime.datetime.timedelta(days=n) : Returns a timedelta object representing a duration of `n` days.

```
import datetime
today = datetime.datetime.now()
tomorrow = today + datetime.timedelta(days=1)
print(tomorrow)  # Output: Current date + 1 day
```

-

5. `sys` Module

The `sys` module provides access to some variables used or maintained by the interpreter.

sys.argv : A list of command-line arguments passed to the script.

```
import sys
print(sys.argv)  # Output: List of command-line arguments
```

-

sys.exit() : Exits from the Python program.

```
import sys
sys.exit("Exiting the program.")  # Output: Program stops with the message
```
