-

sys.version : Displays the version of the Python interpreter.

```
import sys
print(sys.version)  # Output: Python version information
```

-

6. `json` Module

The `json` module is used for parsing JSON (JavaScript Object Notation) data, which is often used for data exchange between applications.

json.dump(obj, file) : Serializes a Python object to a JSON-formatted string and writes it to a file.

```
import json
data = {'name': 'Alice', 'age': 30}
with open('data.json', 'w') as f:
    json.dump(data, f)
```

-

json.load(file) : Deserializes a JSON-formatted string from a file into a Python object.

```
import json
with open('data.json', 'r') as f:
```
