Common Errors and Solutions

Python is a versatile and user-friendly language, but like any programming language, it's not immune to errors. Below are some common errors that Python developers encounter, along with their solutions.

1. SyntaxError

A SyntaxError occurs when Python encounters code that doesn't follow proper syntax rules.

Example:

```
print("Hello World'  # Missing closing quote
```

-

Solution: Ensure that all parentheses, quotes, and other syntax elements are properly closed.

```
print("Hello World")  # Corrected
```

-

2. TypeError

A TypeError is raised when an operation is applied to an object of an inappropriate type.

Example:

```
num = 5
```
