```
result = num + "hello"  # Adding a number and a string
```

-

Solution: Ensure that you are using compatible types in your operations.

```
num = 5
result = str(num) + "hello"  # Corrected
```

-

3. IndexError

An `IndexError` occurs when you try to access an index that is outside the bounds of a list or string.

Example:

```
my_list = [1, 2, 3]
print(my_list[5])  # Index out of range
```

-

Solution: Check the length of the list before accessing an index.

```
my_list = [1, 2, 3]
if len(my_list) > 5:
    print(my_list[5])
```
