-

4. KeyError

A `KeyError` occurs when you try to access a dictionary with a key that doesn't exist.

Example:

```
my_dict = {'name': 'Alice'}
print(my_dict['age'])  # Key not found
```

-

Solution: Use the `.get()` method to safely access dictionary keys.

```
my_dict = {'name': 'Alice'}
print(my_dict.get('age', 'Key not found'))  # Corrected
```

-

5. ValueError

A `ValueError` occurs when a function receives an argument of the correct type but an inappropriate value.

Example:

```
int("Hello")  # Trying to convert a string that can't be converted
```
