```
int num = 3;

if (num > 5) {
    printf("Number is greater than 5\n");
} else {
    printf("Number is not greater than 5\n");
}
return 0;
}
```

Explanation:
In this example, the condition `num > 5` is false, so the `else` block is executed, printing "Number is not greater than 5."

---

3. else-if Ladder

The `else-if` ladder is used to check multiple conditions. Each condition is checked in sequence, and if a true condition is found, the corresponding block is executed.
