Explanation:

The loop continues to execute as long as `i <= 5`. After each iteration, `i` is incremented by 1.

---

3. do-while Loop

The `do-while` loop is similar to the `while` loop, but it guarantees that the block of code is executed at least once, regardless of the condition.

Syntax:

```
do {
    // Code to be executed
} while (condition);
```

Example:

```
#include <stdio.h>
int main() {
    int i = 1;
```
