```
    do {
        printf("%d\n", i);
        i++;
    } while (i <= 5);

    return 0;
}
```

Explanation:

The loop runs the code block once before checking the condition. Then, it continues if `i <= 5`.

Nested Control Structures

Control structures (conditional statements and loops) can be nested within each other to create more complex logic.

Example of Nested `if` Statements:

```
#include <stdio.h>
```
