```
    print(f"Hello, {name}!")

greet("Alice")
```

Explanation:

- `def greet(name):` : Defines a function named `greet` that takes one parameter, `name` .
- `print(f"Hello, {name}!")` : Outputs a greeting message using the provided parameter.
- `greet("Alice")` : Calls the function with the argument `"Alice"` .

Function Parameters:

Functions can have different types of parameters:

Positional Arguments: These are matched by position in the function call.

```
def add(a, b):
    return a + b

result = add(3, 5)  # Positional arguments
```

1.

Keyword Arguments: These are specified using key-value pairs.

```
def describe_pet(animal_type, pet_name):
```
