strstr - Find Substring:

Searches for the first occurrence of a substring in a string.

```
char str[] = "Hello, World!";
char *ptr = strstr(str, "World");  // Points to "World!"
```

6.

String Manipulation Tips:

- Always ensure that the destination array in functions like `strcpy` and `strcat` has enough space to hold the resulting string.
- Use `fgets` instead of `scanf` for safer input handling, as it avoids buffer overflow issues.

Conclusion

Arrays and strings are crucial components of C programming, providing powerful tools for handling collections of data and sequences of characters. Understanding how to declare, initialize, and manipulate arrays and strings will enable you to write more efficient and flexible programs. With practice, these foundational concepts will enhance your ability to solve complex problems and build robust applications.
