```
struct Student {
    char name[50];
    int age;
    float gpa;
};

int main() {
    struct Student student1;  // Declare a structure variable
    return 0;
}
```

In this example:

- The keyword `struct` is used to define the structure.
- `Student` is the structure's name (or tag).
- `name`, `age`, and `gpa` are members of the `Student` structure.
