Accessing Structure Members

You can access structure members using the **dot operator (.)**. Here's an example:

```
#include <stdio.h>

struct Student {
    char name[50];
    int age;
    float gpa;
};

int main() {
    struct Student student1;

    // Assign values to structure members
    strcpy(student1.name, "Alice");
```
