Accessing Members of Nested Structures

Use the dot operator multiple times to access nested members:

student1.address.street

student1.address.city

Unions

What is a Union?

A **union** is a special data type that allows storing different data types in the same memory location. Unlike structures, a union shares the same memory for all its members, so only one member can store a value at any time.

Defining a Union

#include <stdio.h>
