```
    strcpy(data.str, "Hello");

    printf("data.str: %s\n", data.str);

    return 0;
}
```

Key Differences Between Structures and Unions

- **Memory Allocation:** In a structure, each member has its own memory location, whereas, in a union, all members share the same memory.
- **Size:** The size of a structure is the sum of the sizes of all members, but the size of a union is equal to the size of its largest member.
- **Usage:** Use structures when you need to store and access all members independently. Use unions when you want to store different types of data but only one at a time.

Enumerations (Enums)

What is an Enumeration?
